

KiWear Ring — true-scale sizer

Print at 100% — turn off “fit to page”. Check the scale bar below: it should measure exactly 50 mm before you start.

Wrap the strip around your dominant index finger

KiWear Ring is worn on the index finger of your dominant hand — the one you write and swipe with — because the sensors inside the band are laid out for that position. Measure that finger only: your two index fingers can differ by a full size. It fits your middle, ring or little finger too and health tracking keeps working there, but gesture control does not.

Cut along the strip below. Wrap it around the base of that finger — snug, not tight — starting from the 0 edge, and read the size where the strip overlaps. If your knuckle is wider than your finger base, wrap the knuckle instead and use that size.

- Measure in the evening, 6–9pm — fingers sit at their natural daily peak. Re-check the next morning.
- Keep your arm relaxed at your side and your hand loose; measure your dominant index finger, not another finger or your other hand.
- Whole US sizes only. Land between two marks? Always take the larger size.
- The right fit clears your knuckle, sits steady through your day, and leaves no mark after two hours.
